Title : Apparatus for testing the electric field intensity
Periodical : Elektrichestvo, 10, 61-63, O 1955
Abstract : The authors developed a simple portable apparatus, fed from the a-c network, which permits obtaining a picture of the electric field of insulating structures to measure potentials of any point in respect to the ground and voltage distribution in different sectors of the insulating structure. The apparatus consists of a two-step rheostat amplifier with a vacuum-tube voltmeter and a probe. The authors describe details of the apparatus, its connection diagram, and the method of operation. Five diagrams.

AUTHOR:

TITLE: Increasing the dependability of hydropneumatic and hydraulic springs

PERIODICAL: Referativnyy zhurnal, Mashinostroyeniye, no. 24, 1961, 31-32.
abstract 24M184 ("Avtomob. prom-st'", 1961, no. 7, 19-20)

TEXT: The main difficulty in producing hydropneumatic and hydraulic elastic elements is the problem of ensuring the dependability of mobile seals at high pressures; moreover, two contradictory factors have to be considered: ensuring a high airtightness and the necessity of small friction losses. The design of a fluid element with a device for the automatic control of the working fluid level in high pressure cylinders has been developed and tested in the GDR. (See Referativnyy zhurnal, Mashinostroyeniye, 1961, 14M165). The author describes the Soviet design of an analogous element (see Fig.) using a chamber of static pressure. Chambers 1 and 2 are interconnected by an axial channel and radial hole 4 in the plunger. Chambers 2 and 3 are interconnected by holes 5 and 6 in the wall of cylinder 7. During the working stroke valve 8 opens; simultaneously with the overflowing of the fluid into chamber 3 the working

TITLE: Moving cushions for high power dies installed on mechanical presses.
Class B 21c; 7c, 18. No. 152864

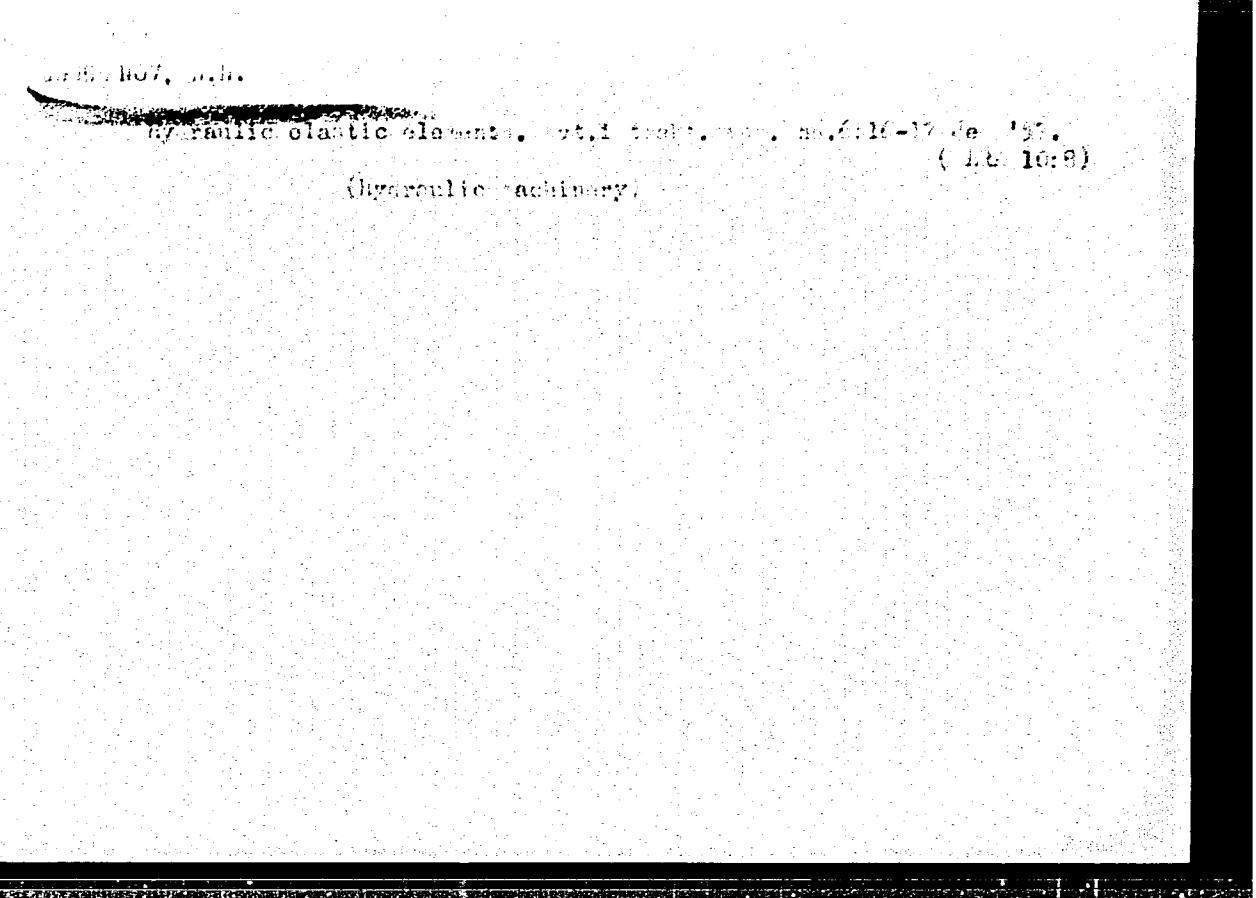

14

SOURCE: Byul. izobreteniy i tovarknykh znakov, no. 3, 1963, 12-13

TOPIC TAGS: punch press, cushion, pneumatic cushion, mechanical press, press

ABSTRACT: Moving cushion for high-power dies installed on mechanical presses, in accordance with author's certificate No. 111334. its distinguishing feature is that in order to expand the range of industrial capabilities of the press, by combining it with a pneumatic cushion, the cylinder of a pneumatic cushion is placed over the cylinder of the moving cushion and on a plunger. Its bottom rests on the stem of the moving cushion which goes through an intermediate chamber, built in into a guide bushing, in which it is held by means of a two-way sliding sleeve, and which is connected to the cylinder of the moving cushion through an opening in the stem, which is covered when the stem drops down.

TITLE: A hydraulic spring for a pneumohydraulic elastic element in vehicle suspension systems. Class 63, No. 190223

SOURCE: Izobreteniya, promyshlennyye obraztsy, tovarnyye znaki, no. 1, 1967, 140

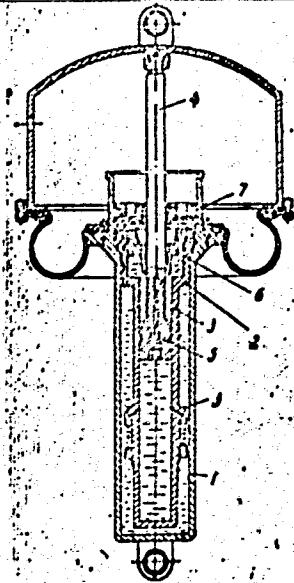

TOPIC TAGS: vehicle suspension system, spring, hydraulic device

ABSTRACT: This Author's Certificate introduces a hydraulic spring for a pneumohydraulic elastic element in a vehicle suspension system. The unit contains a casing which holds a liquid-filled cylinder with radial openings connecting the internal cavity of the cylinder with the cavity between the cylinder and the casing. Located inside the cylinder is a rod with a plunger which divides the cylinder into two working chambers connected by radial and axial passages in the plunger. Mounted in the axial passage is a check valve and on top of the cylinder is a cap with an opening for admission of the rod. In order to achieve optimum characteristics on the compression stroke, the spring is equipped with a floating piston which has an opening for passage of the rod and is mounted in the cylindrical section of the casing. The cavity between the piston and the cap is connected through a channel to the cavity between the cylinder and the casing.

TITLE: Investigating the reflection of elastic-plastic waves in flexible plates
in a resisting medium

SOURCE: AN AzerSSR. Izvestiya. Seriya fiziko-tehnicheskikh i matematicheskikh
nauk, no. 3, 1966, 25-33

TOPIC TAGS: membrane impact, membrane deformation, time variable stress, ~~variable strain~~, material deformation, elastic wave

ABSTRACT: An approximate method is presented for investigating the deformation
of a flexible circular plate under continuous uniform impact load applied to the
reinforced edge of a concentric circular hole. The proposed method is said to be
the most effective for solving nonlinear problems by electronic digital computers.
The problem is treated as symmetrical about the axis normal to the membrane
surface. A system of regular differential equations describing the motion of a
membrane element, the stress-strain relationship, and the dependence of the hydro-
dynamic load (of the surrounding medium) on the angle of attack are used in deriving
the design formulas for calculating the motion parameters of the reinforcing ring
and of the membrane with simply supported and with clamped edges. The variation with

Card 1/2

ACC NR: AP6036943

time of displacements, velocity, acceleration, and strains of the ring and the deformation and stress distribution in the membrane are calculated and plotted in diagrams, showing the effects of clamping on the magnitude of stresses and deformations. A comparison with the results from solving the same problem by the time-consuming method of characteristics shows discrepancies on the order of 20%, which is acceptable for engineering calculations. Orig. art. has: 13 figures and 12 formulas. [WA-52]

TEXT: Values are given of the geothermal gradient and steps for
the chalk deposits of the Prikaspysko-Kubinskaya region and for
the overlaying deposits of the Kirovabadskaya region. The data
were obtained from the temperature curves in the wells taken be-
fore thermal conditions were stabilized. To obtain wider informa-
tion regarding the temperature of the planes surveyed, the author
recommends that temperature measurements collected during any in-
dustrial or geophysical operations should be combined, by means of
maximum thermometers. / Abstracter's note: Complete translation. /

Determination of vitamin B₁ in skin dialyzate. V. A. Rakimyanov and A. N. Tikhomirova (Moscow Med. Inst.), "Vestn. Veterin. Dermatol." 1947, No. 2, 10-12. Vitamin B₁ was detd. (with the Wang-Harris method (C. I. 33, 01884; 30, 2281)) on urine and skin dialyzates both before and after having by daily injection of 10 mg. over a 5-10-day period. The dialyzates were prep'd. by attaching a glass bell (5 sq. cm. area) to the chest, pouring H₂O into the bell, and taking aliquot portions at various intervals. On the 3rd-4th day after having it is possible to detect B₁ in skin dialyzates. No relation was found between this and the urine B₁ level. The skin elimination should be taken into account in tracing sources of vitamin deficiencies. The skin dialyzates were analyzed at 0.5, 1.0, 2.0, 3.0, and 5.0 hrs. after the daily injection.

TITLE: Thermal conduction of porous materials of zirconium dioxide and its dependence on porosity and character of structure

CITED SOURCE: Tr. Mosk. khim.-tekhnol. in-ta im. D. I. Mendeleyeva, vy*p. 41, 1963,
164-172

TOPIC TAGS: zirconium dioxide, porosity, thermal conductivity

TRANSLATION: Thermal conduction of dense articles of ZrO_2 (6 - 13% porosity) is 1.10 - 1.20 kilocalorie/m · hour · degree and practically is not changed within limits of 300 - 1,000°. Increase of porosity of foam samples to 80 - 83% is accompanied by decrease of thermal conduction to 0.30 - 0.23 kilocalorie/m · hour · degree (temperature of 1,000°). Simultaneously during transition from 200 to 1,000° thermal conduction is increased by 20 - 50%. Repeated determination of thermal conduction of foam samples is accompanied by decrease of thermal conduction by 10 - 15%; this is connected with appearance of cracks and flaws during sharp

TITLE: Skin changes in exposed areas in later periods after roentgen and gamma therapy of malignant tumors

SOURCE: Meditsinskaya radiologiya, v. 8, no. 10, 1963, 43-47

TOPIC TAGS: skin change, roentgen therapy, gamma therapy, exposed area skin change, dermovascular response, skin temperature change, hair loss, hair pigmentation change, telangiectasis, sclerotic tissue

ABSTRACT: Skin changes in areas exposed to irradiation were studied in two groups of women 2.5-9 yrs after radiation therapy for malignant tumors of mammary glands, uterus, and ovaries. The first group (21 cases) had been treated with fractional doses of X-irradiation daily for 1-2 mos, and the second group (30 cases) had
